

Considerate use of resources is one of the company's main goals.

TRESU believes that a proactive approach to environmental protection, in order to best avoid negative environmental impacts at all stages of production, is important to improve our environmental performance.

At TRESU, we use SBTi to identify our biggest contributors to our carbon footprint, to reduce this in line with the Paris Agreement on climate change, which aims to gradually become carbon neutral by 2050.

We strive to continuously reduce energy consumption and waste – as well as to increase the use of biodegradable products whenever possible.

When you choose TRESU as your responsible supplier, you can be sure that we have selected our suppliers carefully.

From the selection of subcontractors to the shipping and unpacking of the parts delivered, a sustainable footprint is our main concern.

Our goal is to push this agenda even further, and by choosing TRESU spare- and wear parts, you will also be on your way to a more sustainable production.

TRESU is of course ISO 14001:2015 certified.

It is TRESU's policy, to strive to achieve continuous improvement in all processes, in order to constantly meet the needs of the market. We are committed to complying with legal requirements and binding obligations, as well as to providing the necessary resources to meet these.

In all processes, from ordering to delivery of products and services, we consider, ensure and prioritize quality-, environmental- and working environment conditions.

Of course, all TRESU procedures and policies are continuously optimized when and if possible.
